

A local biomedical staffing firm which provides scientists and supporting research staff to NIH and local Department of Defense research facilities has been tasked with recruiting a science writer for a well-respected PI at the NIH. This PI has accumulated enough data over the past five years for 4 to 5 clinical papers and has recently been given a grant by the NIH Office of the Director to hire a Science Writer to turn this data in to manuscripts. The PI is looking for a bright, problem-solving, resourceful, analytical individual who either has a science background or has the ability to quickly understand the scientific technical components to assist him with this project. The expectation is that this person will be able to do background research; quickly gain technical understanding; collate and analyze clinical and experimental data which has previously been gathered from patients; and write the first draft of multiple manuscripts for publication in clinical and basic science journals. The position is a fulltime contractor position located on the main campus of NIH (Bethesda, MD) that will last one year (the term of the grant). We are able to provide this individual with a competitive salary and full benefits (including health insurance, paid time off, holiday leave, etc.).
